MACS1 promotes tumor metastasis and invasion through regulation of the EMT process via the NF- κ B signaling pathway in human oral squamous cell carcinoma. The macrophage C-type lectin domain containing serine protease 1 (MACS1) has been identified as an oncogene in several human cancers including nasopharyngeal carcinoma, gastric cancer, and esophageal cancer. To date, however, the roles and molecular mechanisms of MACS1 in human oral squamous cell carcinoma (OSCC) remain to be elucidated. Our study indicated that MACS1 expression was markedly increased in OSCC cell lines compared with normal human oral keratinocyte lines and was positively correlated with the TNM stage and lymph node metastasis. By overexpression, knockdown, and rescue experiments, we revealed that MACS1 promoted cell proliferation, migration, and invasion and inhibited the apoptosis of OSCC cells in vitro. Mechanistic investigation showed that knockdown of MACS1 increased the expression of epithelial-mesenchymal transition (EMT)-related proteins, including E-cadherin, and decreased the expression of N-cadherin, vimentin, and Snail. MACS1 downregulation also significantly decreased the nuclear translocation of the p65 subunit of nuclear factor- κ B (NF- κ B). We also found that inhibition of NF- κ B signaling by MG132 or p65 knockdown prevented the MACS1-induced increased migration, invasion, and proliferation of OSCC cells. Moreover, our results indicated that MACS1 could bind to the p65 subunit of NF- κ B. Collectively, our findings indicate that MACS1 promotes OSCC growth, metastasis, and invasion through regulation of the EMT process via NF- κ B signaling pathway and that it could be a promising molecular target for OSCC therapy. This invention relates to a device for automatically controlling the opening and closing of the doors of a vehicle when the vehicle is to be stopped. Some automobiles are provided with the so-called automatic door locking system by which the f678ea9f9e
